## 48. Zonal Spherical Functions on the Quantum Homogeneous Space $SU_q(n+1)/SU_q(n)$

By Masatoshi Noumi,\*) Hirofumi Yamada,\*\*) and Katsuhisa Mimachi\*\*\*)

(Communicated by Shokichi IYANAGA, M. J. A., June 13, 1989)

In this note, we give an explicit expression to the zonal spherical functions on the quantum homogeneous space  $SU_q(n+1)/SU_q(n)$ . Details of the following arguments as well as the representation theory of the quantum group  $SU_q(n+1)$  will be presented in our forthcoming paper [3]. Throughout this note, we fix a non-zero real number q.

1. Following [4], we first make a brief review on the definition of the quantum groups  $SL_q(n+1; C)$  and its real form  $SU_q(n+1)$ .

The coordinate ring  $A(SL_q(n+1; C))$  of  $SL_q(n+1; C)$  is the *C*-algebra  $A = C[x_{ij}; 0 \le i, j \le n]$  defined by the "canonical generators"  $x_{ij} (0 \le i, j \le n)$  and the following fundamental relations:

$$(1.1) x_{ik}x_{jk} = qx_{jk}x_{ik}, x_{ki}x_{kj} = qx_{kj}x_{ki}$$

for  $0 \le i < j \le n$ ,  $0 \le k \le n$ ,

$$(1.2) x_{it}x_{jk} = x_{jk}x_{it}, x_{ik}x_{jt} - qx_{it}x_{jk} = x_{jt}x_{ik} - q^{-1}x_{jk}x_{it}$$

for  $0 \le i < j \le n$ ,  $0 \le k < l \le n$  and

$$\det_q = 1.$$

The symbol det<sub>q</sub> stands for the quantum determinant

(1.4) 
$$\det_{q} = \sum_{\sigma \in S_{n+1}} (-q)^{l(\sigma)} x_{0\sigma(0)} x_{1\sigma(1)} \cdots x_{n\sigma(n)},$$

where  $S_{n+1}$  is the permutation group of the set  $\{0, 1, \dots, n\}$  and, for each  $\sigma \in S_{n+1}$ ,  $l(\sigma)$  denotes the number of pairs (i, j) with  $0 \le i < j \le n$  and  $\sigma(i) > \sigma(j)$ . This algebra A has the structure of a Hopf algebra, endowed with the *coproduct*  $\Delta: A \to A \otimes A$  and the *counit*  $\varepsilon: A \to C$  satisfying

(1.5) 
$$\Delta(x_{ij}) = \sum_{k=0}^{n} x_{ik} \otimes x_{kj} \quad \text{and} \quad \varepsilon(x_{ij}) = \delta_{ij} \quad \text{for } 0 \leq i, j \leq n.$$

Moreover, there exists a unique conjugate linear anti-homomorphism  $a \mapsto a^* : A \to A$  such that

$$(1.6) x_{ji}^* = S(x_{ij}) \text{for } 0 \le i, j \le n$$

with respect to the antipode  $S: A \rightarrow A$  of A. Together with this \*-operation, the Hopf algebra  $A = A(SL_q(n+1; C))$  defines the \*-Hopf algebra  $A(SU_q(n+1))$ .

In what follows, we denote by G the quantum group  $SU_q(n+1)$  and by K the quantum subgroup  $SU_q(n)$  of  $G=SU_q(n+1)$ . Denote by  $y_{ij}$   $(0 \le i, 0 \le i, 0 \le i)$

 $j \le n$ ) the canonical generators for the coordinate ring A(K). Embedding of K into G is then specialized by the C-algebra epimorphism  $\pi_k : A(G) \to A(K)$  such that

(1.7) 
$$\pi_K(x_{ij}) = y_{ij}$$
,  $\pi_K(x_{nn}) = 1$  and  $\pi_K(x_{in}) = \pi_K(x_{nj}) = 0$  for  $0 \le i$ ,  $j < n$ .

2. For a given dominant integral weight  $\Lambda = \lambda_0 \varepsilon_0 + \cdots + \lambda_{n-1} \varepsilon_{n-1}$  ( $\lambda_0 \ge \cdots \ge \lambda_{n-1} \ge 0$ ), there exists a unique irreducible right A(G)-comodule  $V_A$  with highest weight  $\Lambda$ . We denote by  $\Lambda_k$  the fundamental weight  $\varepsilon_0 + \cdots + \varepsilon_{k-1}$  for  $1 \le k \le n$ . As a representation of  $K = SU_q(n)$ ,  $V_A$  can be decomposed into irreducible components. It turns out that  $V_A$  has a trivial representation of K as an irreducible component if and only if the highest weight  $\Lambda$  is of the form  $\Lambda = l\Lambda_1 + m\Lambda_n$  for some  $l, m \in N$  and that the trivial representation may appear with multiplicity one. Such a representation  $V_A$  is said to be of class 1 relative to K.

If  $V_A$  is of class 1, it can be decomposed into the form

$$(2.1) V_{\mathcal{A}} = C v_0 \oplus V_{\mathcal{A}}'$$

as an A(K)-comodule, where  $v_0$  is a K-fixed vector of  $V_A$ . Let  $\{v_1, \dots, v_{N-1}\}$  be a C-basis for  $V_A'$  ( $N = \dim_C V_A$ ) and define the matrix elements  $w_{ij}$  of the representation  $V_A$  by

(2.2) 
$$R_{\scriptscriptstyle G}(v_{\scriptscriptstyle j}) = \sum_{i=0}^{N-1} v_{\scriptscriptstyle i} \otimes w_{\scriptscriptstyle ij} \quad \text{for } 0 \leq j < N.$$

Here  $R_g: V_A \rightarrow V_A \otimes A(G)$  is the structure mapping of the right A(G)-comodule  $V_A$ . Then the matrix element  $w_{00}$  does not depend on the choice of  $v_0, \dots, v_{N-1}$  and is bi-K-invariant in the sense that

(2.3) 
$$R_{\scriptscriptstyle K}(w_{\scriptscriptstyle 00})\!=\!w_{\scriptscriptstyle 00}\!\otimes\!1\quad\text{and}\quad L_{\scriptscriptstyle K}(w_{\scriptscriptstyle 00})\!=\!1\!\otimes\!w_{\scriptscriptstyle 00},$$
 where

 $R_{\scriptscriptstyle{K}} \! = \! (id \otimes \pi_{\scriptscriptstyle{K}}) \circ \varDelta \quad ext{and} \quad L_{\scriptscriptstyle{K}} \! = \! (\pi_{\scriptscriptstyle{K}} \! \otimes \! id) \circ \varDelta.$  We call  $w_{\scriptscriptstyle{00}}$  the zonal spherical function of  $V_{\scriptscriptstyle{A}}$  relative to K.

3. We introduce the notation of quantum r-minor determinants. Let I and J be two subsets of  $\{0, 1, \dots, n\}$  with  $\sharp I = \sharp J = r$ . Arrange the elements of I and J in the increasing order:  $I = \{i_0, \dots, i_{r-1}\}$   $\{0 \le i_0 < \dots < i_{r-1} \le n\}$  and  $J = \{j_0, \dots, j_{r-1}\}$   $\{0 \le j_0 < \dots < j_{r-1} \le n\}$ . We define the quantum r-minor determinant  $\xi_J^I$  by

(3.1) 
$$\xi_J^I = \xi_{j_0 \dots j_{r-1}}^{i_0 \dots i_{r-1}} = \sum_{\sigma \in S_r} (-q)^{l(\sigma)} x_{i_0 j_{\sigma(0)}} x_{i_1 j_{\sigma(0)}} \dots x_{i_{r-1} j_{\sigma(r-1)}}.$$

If  $I = \{0, 1, \dots, r-1\}$ , we use the abbreviation  $\xi_I = \xi_I^I$ .

To investigate spherical functions, we give a geometric realization of  $V_A$  (cf. [3]).

Let  $\Lambda = \Lambda_{\mu_0} + \Lambda_{\mu_1} + \cdots + \Lambda_{\mu_{k-1}}$   $(\mu_0 \ge \cdots \ge \mu_{k-1} > 0)$  be a dominant integral weight. Let  $J = (J_0, \cdots J_{k-1})$  be a sequence of non-empty subsets of  $\{0, 1, \dots, n\}$  with  $\sharp J_s = \mu_s$  for  $0 \le s < k$ . We call J a column strict plane partition of shape  $\Lambda$  if the following conditions are satisfied:

(3.2) 
$$\begin{cases} J_s = \{j_{0,s}, \cdots, j_{\mu_s-1,s}\} \subset \{0, 1, \cdots, n\}, \\ j_{r,s} < j_{r+1,s} \text{ and } j_{r,s} \leq j_{r,s+1}. \end{cases}$$

The irreducible representation of  $V_A$  can be realized as a right sub-A(G)-

comodule as

$$(3.3) V_{\Lambda} = \sum_{J} C \xi_{J} \subset A(G),$$

where the sum is taken over the set of all column strict plane partitions of shape  $\Lambda$  and

(3.4) 
$$\xi_{J} = \xi_{J_0} \cdots \xi_{J_{k-1}} \quad \text{if } J = (J_0, \cdots, J_{k-1}).$$

It is seen that these vectors  $\xi_J$  are linearly independent and that they form a *C*-basis for a right A(G)-comodule. Note that the product of minor determinants

$$\xi_{01...\mu_{0}-1}\cdots\xi_{01...\mu_{k-1}-1}$$

gives the highest weight vector of  $V_A$ . We remark that  $V_A$  is identified with the vector space of all left relative  $B_-$ -invariants in  $A(SL_q(n+1; C))$  with respect to the character corresponding to A, where  $B_-$  is the Borel subgroup "of lower triangular matrices" (see [3]).

If  $\Lambda = l \Lambda_i + m \Lambda_n$   $(l, m \in N)$ , the spherical representation  $V_A$  contains a K-fixed vector

$$(3.6) v_0 = (\xi_n^0)^l (\xi_{01...n-1}^{01...n-1})^m.$$

By using algebraic properties of quantum minor determinants, we can determine explicitly the zonal spherical function of  $V_A$  in terms of basic hypergeometric series  $_2\varphi_1$ :

$$(3.7) _2\varphi_1\left(\begin{matrix} a,b\\c \end{matrix}; q,z \right) = \sum_{k=0}^{\infty} \frac{(a;q)_k(b;q)_k}{(c;q)_k(q;q)_k} z^k, (a;q)_k = \prod_{j=0}^{k-1} (1-aq^j).$$

Theorem. Let  $V_{\scriptscriptstyle A}$  be the representation of  $G\!=\!SU_{\scriptscriptstyle q}(n\!+\!1)$  with highest weight  $\Lambda\!=\!l\Lambda_1\!+\!m\Lambda_n$  ( $l,m\in N$ ). Then the zonal spherical function  $w\!=\!w_{\scriptscriptstyle 00}$  of  $V_{\scriptscriptstyle A}$  relative to  $K\!=\!SU_{\scriptscriptstyle q}(n)$  is expressed by a basic hypergeometric series in  $z\!=\!1\!-\!x_{\scriptscriptstyle n},\!\xi_{\scriptscriptstyle 01,\ldots,n-1}^{\scriptscriptstyle 01,\ldots,n-1}$  as follows:

(3.8) 
$$w = (x_{nn})^{l-m} {}_{2}\varphi_{l} \left( \begin{matrix} q^{-2m}, & q^{2(l+n)} \\ q^{2n} \end{matrix}; q^{2}, q^{2}z \right)$$
 if  $l \ge m$ ,

and

The above polynomials in z are so-called *little q-Jacobi polynomials*. As for *zonal* spherical functions, Theorem generalizes a result of [1, 2].
